

Project Memory and Documentation Operations

Swasthya Katha — Living Project Record

Version: 1.0

Status: Operational template

Date: 24 August 2026

1. Purpose

This document prevents loss of project context during long development cycles and AI-assisted implementation. It records what is complete, what is active, what is blocked, which files changed, which decisions were made, and what evidence exists.

2. Single source of operational truth

Maintain these files:

```
docs/09-project-memory.md
docs/release-log.md
docs/risk-register.md
docs/implementation-dependency-map.md
docs/decisions/
docs/feature-tickets/
```

3. Current status template

```
Project:
Milestone:
Overall status:
Current phase:
Current owner:
Active ticket:
Active file:
Blocked ticket:
Blocked file:
Last updated:
Next review:
```

4. Initial status

```
Project: Swasthya Katha
Milestone: M0 — Documentation and discovery
Overall status: Documentation baseline prepared
Current phase: Discovery and foundation
Current owner: Product and engineering lead
```

Active ticket: M0-001 – Approve project baseline
Active file: docs/09-project-memory.md
Blocked ticket: None at documentation level
Blocked file: None at documentation level
Last updated: 2026-08-24
Next review: After product, clinical, security, and language decisions

5. Required update after every task

Date:
Task ID:
Agent or owner:
Objective:
Files inspected:
Files created:
Files changed:
Tests run:
Browser verification:
Accessibility verification:
Security verification:
Performance verification:
Clinical/content impact:
Evidence location:
Known limitations:
Blockers:
Decision required:
Next recommended task:

6. Completed work register

Initially completed:

- Product vision outlined.
- Audience requirements identified.
- Magazine and linear modes defined.
- Audio and visual synchronization defined.
- Multilingual architecture identified.
- SVG/WebGL progressive enhancement defined.
- Security and privacy direction defined.
- Documentation set created.
- Initial feature backlog defined.

Update this list only when evidence exists.

7. Active work register

Work item: Confirm launch geography
Owner: Product lead
Status: Open
Decision needed: Country, age group, service referral scope
Impact: Clinical content, language, privacy, and deployment
Next action: Conduct stakeholder review

Work item: Select prototype lessons
Owner: Product and clinical lead
Status: Open
Decision needed: First three lessons
Impact: M1 scope and comprehension testing
Next action: Approve storyboards

8. Blocker register format

A blocker must contain:

- Blocker ID.
- Exact issue.
- Affected ticket.
- Affected milestone.
- Affected file.
- Why safe progress cannot continue.
- Owner required.
- Options.
- Decision deadline.
- Current status.

Example:

Blocker: BLK-001
Issue: Launch languages not confirmed
Affected milestone: M6
Affected files: content/, messages/, audio/
Why blocked: Translation and narration scope cannot be finalized
Owner required: Product and program lead
Options: Start with English/Hindi; delay localization; run language discovery
Status: Open

9. Decision record format

```
Decision ID:  
Date:  
Context:  
Options considered:  
Decision:  
Reason:  
Consequences:  
Approver:  
Related tickets:  
Review date:
```

10. AI agent memory rules

An AI agent must:

- Read current memory before starting.
- Read linked decision records.
- Avoid reopening settled decisions without reason.
- Record every changed file.
- Record tests and failed tests.
- Identify uncertainty.
- Never claim success without evidence.
- Never hide a blocker.
- Update memory before ending the task.

11. Daily project update

```
Date:  
Yesterday completed:  
Today's objective:  
Current ticket:  
Files being worked on:  
Expected evidence:  
Known risk:  
Blocker:  
Next checkpoint:
```

12. Weekly review

Review:

- Milestone progress.
- Outcome evidence.
- P0/P1 defects.

- Clinical status.
- Translation status.
- Accessibility status.
- Security status.
- Performance status.
- Technical debt.
- Decisions needed.

13. Release log format

```
Release version:  
Date:  
Environment:  
Application commit:  
Publication version:  
Locales:  
Clinical approval:  
Language approval:  
Accessibility approval:  
Security approval:  
Performance approval:  
Known limitations:  
Rollback target:  
Owner:
```

14. Evidence policy

Evidence must be specific enough for another person to reproduce or verify the claim:

- Exact test command.
- Browser and version.
- Device model.
- Network profile.
- Screenshot or recording.
- Reviewer name and date.
- Publication version.
- Ticket ID.

15. Memory quality rules

Project memory is healthy when:

- Current active ticket is obvious.
- Blockers are visible.

- No stale status is older than the agreed review period.
- Every release has a record.
- Every major decision has a rationale.
- Tests are tied to work items.
- Agent output can be audited.
